INTEREST OF AMICI CURIAE

Amici curiae are geographically diverse counties and cities across the United States that maintain public health departments, own or operate hospitals or clinics, or otherwise fund healthcare services for their residents.¹ As local governments, amici are responsible—both in practice and often by legal mandate—for protecting the health and wellbeing of their communities. Many local governments provide direct medical services focused on serving indigent and other underserved populations, including reproductive healthcare services and services to persons who have been, are, or hope to become pregnant. In addition, local governments often provide emergency medical transportation and public health services, operate law enforcement agencies and jail facilities, maintain public infrastructure, assist vulnerable children and the elderly, promote economic security, and respond to public emergencies. Accordingly, amici have a strong interest in ensuring public safety and welfare in the medical sphere and beyond.

Amici submit this brief to provide critical context about the harm to local governments, and the significant and dangerous consequences to the welfare of our communities, of stripping away EMTALA's guarantee of timely emergency care for pregnant patients who are suffering from emergency medical conditions that require immediate termination of the pregnancy in order to stabilize the patient's condition.

¹ Amici are the County of Santa Clara, California; County of Milwaukee, Wisconsin; Contra Costa County, California; City of Gary, Indiana; City and County of San Francisco, California; City of Saint Paul, Minnesota; City of Cincinnati, Ohio; County of Marin, California; County of Monterey, California; Cook County, Illinois; County of Los Angeles, California; Harris County, Texas; and City of New York, New York.

SUMMARY OF ARGUMENT

The Emergency Medical Treatment and Labor Act (EMTALA)² is a pillar of the national healthcare safety net. For nearly four decades, it has protected patients and promoted public health, while ensuring that hospitals share the responsibility for providing stabilizing care to all patients suffering from emergency medical conditions. Allowing states to exempt their hospitals from EMTALA's mandate with respect to pregnancy-related complications that require termination of a pregnancy would place patients in danger, undermine public health, and upset the balance that EMTALA struck with respect to emergency medical services. Such a ruling would impose additional strain on the healthcare safety net and would harm local governments and the communities they serve.

a. Allowing states to block medically necessary emergency abortions would undermine EMTALA's goal of ensuring that hospitals share in the responsibility of providing emergency medical services to our communities. In addition to depriving individual patients of medically necessary care, such a ruling would force safety net hospitals in states that offer comprehensive emergency medicine, including public hospitals operated by local governments, to bear the cost of treating patients whom other hospitals have refused to provide with critical emergency care. These hospitals would be forced to reallocate already scarce resources to provide critical emergency care that should have been provided to patients in their home state before their condition deteriorated further. This would further strain the operations of safety net providers that already operate with thin financial margins and serve

² 42 U.S.C. § 1395dd.

some of the nation's most vulnerable patient populations. Such an outcome would contravene the purpose of EMTALA, putting the same patients that EMTALA sought to protect at risk and undermining the operations of critical safety net healthcare providers that serve the public.

b. Allowing states to prohibit or delay medically necessary emergency abortions threatens to erode public trust in healthcare providers to the detriment of the broader public health and welfare. Patients in need of emergency abortions would no doubt find their confidence in the healthcare system shaken if physicians were allowed—much less *required*—to withhold medically necessary stabilizing treatment, thereby forcing patients to endure harmful and potentially life-threatening health complications. These dangerous and harmful medical encounters may also affect the larger community's relationships with the healthcare system. Indeed, patients who feel that a relative has received poor health care tend to report a loss of trust in their own healthcare providers and the healthcare system.

The harmful consequences of this loss of public trust in healthcare providers are significant. Mistrust of healthcare providers contributes to delays in seeking care and failure to follow medical advice, both of which can lead to worse healthcare outcomes. Worsened health outcomes, in turn, can result in more costly and intensive medical interventions that can have devastating financial repercussions for families. Poor health outcomes can also negatively affect school attendance, familial relationships, and worker productivity. In addition, the increased strain on the social safety net as a result of the cascading effects of delayed medical care could interfere with local governments' ability to provide broader safety net services.

ARGUMENT

As local governments responsible for promoting the health and welfare of their communities, amici respectfully urge the Court to affirm the district court's grant of a preliminary injunction. The district court's preliminary injunction barred the State of Idaho from enforcing the abortion restrictions set out in Idaho Code section 18-622 to the extent those limitations conflict with the requirements of the federal Emergency Medical Treatment and Labor Act (EMTALA). As set forth in the Brief for Respondent, reversal of the district court's order would seriously undermine patients' ability to receive medically necessary emergency abortions. This, in turn, would expose patients experiencing dangerous pregnancy complications to significant, potentially life-threatening health repercussions that would have a harmful ripple effect not only on the patients themselves, but on the broader community and local safety net systems upon which our communities rely.

As explained in the amici curiae brief filed by the American College of Obstetricians and Gynecologists, if the Court were to hold that EMTALA does not require hospitals to provide medically necessary abortions even when doing so is necessary to stabilize a patient's condition, patients experiencing serious complications in Idaho, and in other states that restrict the availability of medically necessary abortions, would be forced to either wait while physicians delay medically necessary and potentially life-saving emergency care, or to risk interstate travel while in an unstable medical condition. Neither of these adverse outcomes serve the purposes for which EMTALA was enacted.

In addition to endangering individual patients, allowing states to block medically necessary emergency abortions would undermine EMTALA's goal of ensuring

that hospitals share the responsibility for providing emergency medical care. Such a decision would force hospitals that provide comprehensive emergency services, especially safety net hospitals in states that do not obstruct medically necessary abortions, to reallocate scarce public resources to treat out-of-state patients whose condition may have deteriorated because they were forced to travel while in an unsafe medical condition. Given the significant operational and financial challenges already facing local safety net healthcare facilities—which deploy limited public resources to serve vulnerable and high-need members of the public—these providers can ill-afford to bear the cost of so-called “patient dumping.”

Finally, allowing states to prevent or delay healthcare providers from performing medically necessary emergency abortions would threaten to harm public health more broadly by undermining patients’ trust that the healthcare system will be responsive to their needs or the needs of their loved ones. Building and maintaining patient trust is paramount to healthcare providers’ ability to treat patients, encourage healthy behaviors, and facilitate positive health outcomes for the public. Without that trust, patients may doubt that they can obtain the care they need and may, as a result, delay or altogether forgo seeking critical care. When segments of the population do not or cannot access adequate health care, the wellbeing of the entire community is undermined. And increases in the costs associated with delayed medical care are likely to limit local governments’ ability to provide safety net healthcare services more broadly.

For the foregoing reasons, amici respectfully urge the Court to affirm the district court’s preliminary injunction ruling.

I. Allowing States to Block Medically Necessary Emergency Abortions Would Undermine EMTALA's Goal of Ensuring Hospitals Share Responsibility for Emergency Medical Services.

As set forth above, amici are local governments that maintain public health departments, own or operate hospitals or clinics, or otherwise fund healthcare services for our residents. As entities that help comprise the fabric of the healthcare safety net, amici have a strong interest in preserving its safeguards. One of those safeguards is EMTALA, which requires virtually all hospitals to provide patients who are experiencing emergency medical conditions with the stabilizing care they need.³ Indeed, EMTALA has long required that emergency departments provide medically necessary emergency abortion care. Upsetting this well-settled understanding of EMTALA would weaken the safety net systems operated by local jurisdiction and place patients at risk.

³ See H.R. Rep. No. 99-241, pt. 1 at 27 (1985), as reprinted in 1986 U.S.C.C.A.N. 579, 605 (“All participating hospitals with emergency departments would be required to provide an appropriate medical screening examination . . . to determine whether an emergency medical condition exists” and “to stabilize the medical condition or provide treatment for the labor[.]”); see also W. Wesley Fields et al., *The Emergency Medical Treatment and Labor Act as a Federal Health Care Safety Net Program*, 8 Acad. Emer. Med. 1064, 1064-65 (2001) (“The U.S. emergency medical care system continues to operate on the basis of universal access to care for all who seek it, and [emergency departments] play a vital role as core safety net providers in today’s healthcare system. As mandated by EMTALA, emergency services are uniformly available to all . . . [Emergency departments] have emerged as perhaps the most visible safety net facilities in the current health care environment.”).

One of the primary reasons Congress passed EMTALA was to end so-called “patient dumping,” a practice that places patients in grave danger by depriving them of critical and time-sensitive emergency care. Traditionally, patient dumping occurred when a patient sought care at a private hospital’s emergency department and was either turned away or transferred to a public safety net hospital because they were unable to pay.⁴ In the mid-1980s, for example, physicians at Cook County Hospital in Chicago published two articles documenting patient dumping at their facility. Their research showed that patients who were transferred were twice as likely to die as those treated at the transferring hospital; nearly a quarter were transferred in unstable condition.⁵ And Cook County was not alone—transfers had risen precipitously across the country, from New York to Dallas to California.⁶

In the wake of these reports, Congress passed EMTALA. In doing so, Congress determined that hospitals owe patients a safety net in emergencies. Though EMTALA applies specifically to hospitals that participate in Medicare, “this encompasses almost 98% of all US hospitals.”⁷ Medicare is a foundational funding source that accounts for approximately twenty-one percent of total national health expenditures and is one of the primary sources of funding in our healthcare

⁷ See Zibulewsky, *supra* note 5, at 340.

system.⁸ In the case of public hospitals operated by local governments, this funding is critical to ensuring the hospitals' ability to offer care to vulnerable members of the community, and provides a tremendous benefit to the national healthcare safety net more broadly.

The passage of EMTALA further bolstered the healthcare safety net and protected patients by making both public and private hospitals *part* of the safety net for emergency care. As one senator explained, EMTALA was meant “to send a clear signal to the hospital community . . . that all Americans, regardless of wealth or status, should know that a hospital will provide what services it can when they are truly in physical distress.”⁹ This time-sensitive emergency care is meant to be provided locally at a nearby hospital. Indeed, when an ambulance receives a patient who is experiencing a medical emergency, they are generally required (subject to certain exceptions) to transport the patient to the *nearest* hospital that can provide the requisite care. In contrast, a decision permitting States to exempt their hospitals from the obligation to provide critical emergency medical care to pregnant patients—namely, medically necessary abortions—would turn back the clock and push the obligation to provide critical care onto the emergency departments of neighboring states' hospitals, to the detriment of both patients and neighboring states' safety net systems.

⁸ Centers for Medicare & Medicaid Services, *NHE Fact Sheet*, CMS (Dec. 13, 2023), <https://www.cms.gov/data-research/statistics-trends-and-reports/national-health-expenditure-data/nhe-fact-sheet#:~:text=Medicare%20spending%20grew%205.9%25%20to,29%20percent%20of%20total%20NHE>.

⁹ 131 Cong. Rec. 28568 (1985) (statement of Sen. Durenberger).

Patients experiencing serious pregnancy complications in Idaho, or in other states that curtail access to medically necessary emergency abortion, would be forced to suffer as their health deteriorates, sometimes irreparably, while physicians delay or forgo emergency care. In particular, patients with limited means—one of the key populations EMTALA was enacted to protect—will be left with no option but to wait while their emergency medical condition worsens. These financially vulnerable patients may lack the money to travel out of state or to secure childcare during their absence, and they may be unable to afford to miss work for the extended period required to travel out of state for emergency care. Inevitably, these patients, whom EMTALA especially sought to protect, will be turned away with no recourse.

Patients who are able to seek emergency care out of state will also face significant health risks as a result of traveling in an unstabilized medical condition. But the harm does not end there. The out-of-state safety net providers that receive these patients will be forced to divert scarce resource to provide critical emergency care that should have been provided to patients in their home state *before* those patients' condition deteriorated further. Public safety net health systems that offer comprehensive emergency medicine, especially public hospitals operated by local jurisdictions, can ill afford to shoulder the cost of out-of-state patient dumping, which harms patients and safety net providers alike.

Safety net facilities are “providers of last resort, providing care to all patients, regardless of their

ability to pay.”¹⁰ Many public hospitals primarily serve low-income Medicaid patients. For instance, in California in 2021, Medicaid patients “accounted for nearly 60% of hospitalizations at county hospitals and nearly half” at other safety net hospitals that “receive supplemental funding—compared to about one-third at all other hospitals.”¹¹ Consequently, public hospitals also serve a large percentage of Medicaid-covered births.

In short, safety net providers fill critical gaps in the availability of services, support access to care in underserved communities, and provide a disproportionate share of uncompensated and undercompensated care, all while operating with razor-thin financial margins.¹² At the same time, safety net providers face unprecedented hurdles in continuing to deliver high-quality care to underserved patients. Even before the COVID-19 pandemic, acute staffing and resource shortages loomed.¹³ In the pandemic’s wake, margins are thinner and staff shortages more severe.¹⁴ These

challenges have hit public hospitals hardest because they serve a more vulnerable patient population and deliver more uncompensated or undercompensated care.

Forcing beleaguered safety net providers to shoulder the cost of providing emergency care for out-of-state patients who were denied medically necessary emergency abortions in their home state will only exacerbate these problems. Public safety net hospitals, many of which are operated by local governments, will be forced to provide resource intensive emergency care that will often be more invasive, expensive, and complex as a result of the patient's unstabilized condition and the delay in care during travel.¹⁵ For example, when patients with certain pregnancy complications cannot access necessary emergency abortion services, their risk of sepsis increases.¹⁶ Sepsis, which is described in greater detail *infra*, is the most expensive reason for a hospitalization: an average hospital stay for sepsis costs double the stay

itals-struggle-endangers-care-for-low-income-patients/; Assistant Sec'y for Plan. & Evaluation, Off. Health Pol'y, *Impact of the COVID-19 Pandemic on the Hospital and Outpatient Clinician Workforce: Challenges and Policy Responses* 1, 3-4 (2022), <https://aspe.hhs.gov/sites/default/files/documents/9cc72124abd9ea25d58a22c7692dccb6/aspe-covid-workforce-report.pdf>.

Hospital Ass'n (Sept. 21, 2021) (explaining that patients who put off care during the pandemic became sicker and required more expensive care), <https://www.aha.org/press-releases/2021-09-21-new-report-costs-caring-sicker-patients-drive-continued-hospital-and>.

¹⁶ L. Lewis Wall & Awol Yemane, *Infectious Complications of Abortion*, 9 *Open Forum Infectious Diseases*, Nov. 23, 2022, at 4.

for another diagnosis.¹⁷ Treating patients who have been denied care at a facility in another state, and now face major complications like sepsis, will hit public hospitals particularly hard.

For emergency services, all hospitals are supposed to share the responsibility of providing stabilizing emergency care. This care is meant to be provided locally to ensure timely intervention. Removing pregnant patients in need of emergency abortion care from this equation will return hospitals to the pre-EMTALA status quo with respect to these pregnancy-related medical circumstances. Even worse, it would allow not just select private hospitals but *entire states* to deny patients emergency care and push this responsibility onto the doorstep of neighboring states' hospitals and social safety net systems at a time when the healthcare safety net is already strained. Meanwhile, patients who lack the means to seek emergency care out of state—though theoretically among EMTALA's key beneficiaries—will find the protections EMTALA affords them illusory as they have no choice but to wait while their emergency condition worsens.

II. Allowing States to Prohibit or Delay Medically Necessary Emergency Abortions Threatens to Erode Public Trust in Healthcare Providers and Thereby Undermine the Public Health and Welfare.

As explained in the amici curiae brief filed by the American College of Obstetricians and Gynecologists, denying or delaying the treatment of patients with severe pregnancy complications has serious consequences at the individual medical level. Beyond that, it also threatens to undermine trust in the healthcare system more broadly, particularly among under-served communities, to the detriment of public health and community wellbeing. Because local governments play an essential role in promoting and protecting public health and welfare, amici have a strong interest in preventing these harms and, for this additional reason, urge the Court to uphold the district court's preliminary injunction.

A. Allowing States to Prohibit or Delay Medically Necessary Emergency Abortions Will Undermine Patient Trust.

Put simply, forcing physicians to delay or deny medically necessary abortions to patients suffering from serious health conditions would undermine patients' confidence that healthcare professionals are willing and able to help them. Research shows that patients who have negative medical experiences or feel betrayed by medical institutions are more likely to disengage from healthcare systems and less likely to adhere to medical advice.¹⁸ This would exacerbate existing medical skepticism and further erode trust in medical

¹⁸ Carly Parnitzke Smith, *First, Do No Harm: Institutional Betrayal and Trust in Health Care Organizations*, 10 J. Multidisc. Healthcare 133, 137, 140-42 (2017).

practitioners and institutions—trust that is foundational to effective patient care. Furthermore, even patients who have a high degree of trust in healthcare providers and systems may find their confidence irreparably shaken if physicians withhold necessary medical care or force patients to “get sicker” and endure potentially life-threatening health complications before providing needed care.¹⁹ For example, in response to newly-effective abortion restrictions in some states, some physicians have delayed abortions for patients who presented with ruptured membranes prior to fetal viability. Extremely premature rupture of the membranes of the amniotic sac is a dangerous pregnancy complication that requires urgent care.

During a typical pregnancy, the membranes will rupture at or around full term, at which point the patient will go into labor. However, if the pregnancy is still in the early stages when the membranes rupture, the patient may not go into labor. At this point, the patient faces a serious risk of infection because the placenta and fetus remain inside the uterus, even though the pregnancy is failing. Allowing the pregnancy to continue despite the ruptured membranes puts the pregnant patient’s health in grave danger. If doctors do not promptly terminate the pregnancy, the patient is at risk of developing an infection that could in turn lead to sepsis—a life-threatening condition in which the body’s response to infection causes inflammation and blood clotting that impairs blood flow and

¹⁹ See Whitney Arey et al., *A Preview of the Dangerous Future of Abortion Bans—Texas Senate Bill 8*, 387 *New England J. of Med.* 388, 389 (2022) (describing a patient’s anger and sadness at having to either “wait[], and . . . potentially get sicker,” or fly to another state and risk having a medical emergency in transit).

can damage vital organs and even lead to death.²⁰ Complications arising from delays in care can also cause hemorrhaging or scarring of the uterus that permanently impairs fertility. In some cases, patients may be forced to undergo a hysterectomy due to the advanced progression of the infection, preventing them from being able to get pregnant in the future. These severe physical harms are compounded with the psychological distress and trauma that patients will suffer from being forced, against their wishes and contrary to their medical providers' judgment, to carry a pregnancy that is very unlikely to result in a successful delivery but continues to cause physical suffering and threaten their long-term health and reproductive ability.²¹

The risk of such trauma and suffering is not hypothetical. In several instances, due to restrictions similar to the one at issue here, physicians have waited until a patient developed a life-threatening condition before providing care.²² Indeed, in 2022,

²⁰ See *Sepsis*, Mayo Clinic (Feb. 10, 2023), <https://www.mayoclinic.org/diseases-conditions/sepsis/symptoms-causes/syc-20351214>; see also *What is Sepsis?*, Ctr. for Disease Control and Prev. (Aug. 24, 2023), <https://www.cdc.gov/sepsis/what-is-sepsis.html>.

²¹ Unnecessarily delaying medically necessary abortions, to the detriment of patient health and at the risk of their lives, is contrary to medical ethics in general. See Am. College of Obstet. & Gyn., *Code of Professional Ethics* 2 (Dec. 2018). And delaying care is particularly egregious where the fetus's development is no longer compatible with life—including, for example, in many cases of preterm premature rupture.

²² See, e.g., Arey, *supra* note 19, at 389; Laura Santhanam, *How Abortion Bans Will Likely Lead to More Deadly Infections*, PBS NewsHour (July 27, 2022, 2:13 PM EDT), <https://www.pbs.org/newshour/health/how-abortion-bans-will-likely-lead-to-more-deadly-infections> (physician describing a sharp increase in the

Missouri resident Mylissa Farmer was denied an abortion at two different hospitals—one in Missouri and one in Kansas—after experiencing a preterm premature rupture of membranes at around 18 weeks.²³ Despite advising Ms. Farmer that her pregnancy was failing and that her condition could rapidly deteriorate—resulting in infection, hemorrhage, and potentially death—healthcare providers refused to provide her with an abortion because a fetal heartbeat could still be detected.²⁴ In Ms. Farmer’s words: “It was dehumanizing. It was terrifying.”²⁵ Ms. Farmer ultimately traveled to a *third* state to receive the abortion she needed—an option that will not be viable for every patient, whether due to limited financial means or other reasons.

Ms. Farmer’s experience was not unique. In the wake of Florida’s 15-week abortion ban, doctors in Florida refused to perform an abortion or induce labor for a woman whose water broke *five months* before her due date. The doctors instead sent the woman, Anya

number of patients experiencing sepsis or hemorrhage during pregnancy).

Cook, home.²⁶ Ms. Cook then delivered alone in a bathroom knowing her baby would not be born alive, and nearly bled to death afterwards despite being rushed to the hospital.²⁷

Without the full protections of EMTALA, residents of Idaho and other states that severely curtail access to medically necessary abortions who are or may become pregnant will be left in a state of uncertainty about whether healthcare providers will be willing and able to help them if they find themselves rushed to the emergency room with a pregnancy complication that threatens their life or health. Many of those who are inevitably turned away and refused critical, health-preserving care will undoubtedly find their trust in our healthcare system devastated.

**B. Allowing States to Prohibit or Delay
Medically Necessary Emergency
Abortions Will Harm the Broader Public.**

The dangerous and harmful medical encounters discussed above are likely to negatively affect public health and welfare, including by undermining the larger community's relationship with healthcare providers and the healthcare system. Not only patients, but also their loved ones, may find it difficult to trust the healthcare system in the future. Indeed, research shows that patients who feel that a relative has received poor or inadequate health care tend to report a loss of trust in their *own* healthcare providers and the healthcare system, and are more likely to avoid

²⁷ *Id.*

seeking medical care.²⁸ This ripple effect means that the negative health repercussions of delaying or denying medically necessary abortions extend far beyond those specific incidents and threaten to harm public health by undermining broader trust in, and engagement with, the healthcare system.

The harmful consequences of this loss of trust are hard to overstate. Public trust is fundamental to healthcare professionals' ability to treat patients, encourage healthy behaviors, and facilitate positive health outcomes more broadly. Among other things, trust in healthcare professionals is associated with patients engaging in beneficial health behaviors and reporting higher satisfaction with their health care, improvement in symptoms, and better quality of life as it relates to health,²⁹ whereas mistrust of healthcare providers contributes to delays in seeking care, which can lead to worse healthcare outcomes.³⁰ Patients who distrust medical providers are also more likely to fail to follow the medical advice they are given.³¹ Undermining confidence in healthcare professionals, therefore, has serious consequences for the public health.

But the impact on patients and the broader community does not end there. Worsened health outcomes negatively affect many aspects of community wellbeing beyond physical health. Delays in seeking out or receiving medical care can result in more costly and intensive medical interventions. The burden of increased medical expenses, in turn, can have serious and destabilizing repercussions for families and communities. Some families struggling to pay medical expenses resort to payday lenders or sacrifice necessities like food and clothing to pay for medical care, and medical debt is a leading cause of bankruptcy in the United States.³²

Worsened public health outcomes can also negatively affect important areas such as school attendance and participation, familial relationships and stress, career advancement, and worker productivity.³³ For example, children's frequent illness and doctor's appointments can interfere with their school attendance while simultaneously limiting their parents' ability go to work and to progress in their careers. Meanwhile, parents struggling with serious health complications may have trouble finding the time or energy to help their children complete homework or to plan family bonding activities, while also managing their own health and potentially strained finances. Each of these has cascading effects on the wellbeing of families and

communities, which further underscores the importance of preserving public health and promoting trust in, and engagement with, the healthcare system. Reversing the district court's decision would have the opposite effect.

Finally, declines in public health are likely to result in more complicated and expensive care—not only in states that receive patients seeking emergency abortions after being previously denied care, but even more so in states that limit access to this important, time-sensitive care. Increased medical costs, in turn, are likely to limit the funding available for local jurisdictions that offer safety net healthcare services to provide the preventative and primary care services that help produce better health outcomes for the public, or to provide other essential public services. As entities tasked with protecting the public health and welfare, amici urge the Court to consider how delaying medically necessary care may impair local governments' ability to effectively care for and provide safety net services to their communities.

CONCLUSION

For the reasons set forth above, amici respectfully urge the Court to affirm the district court's preliminary injunction ruling.

Respectfully submitted,

SCOTT F. BROWN
