Docket No: 24-2735

24-CV-6653 (LTS)

ORDER OF DISMISSAL UNDER
28 U.S.C. § 1915(g)

LAURA TAYLOR SWAIN, Chief United States District Judge:

Plaintiff, who is currently incarcerated at Kern Valley State Prison in Delano, California, brings this action *pro se*. Plaintiff did not pay the filing fees to bring this action, and the Court understands that Plaintiff seeks leave to proceed without prepayment of fees, that is, *in forma pauperis* (“IFP”). Plaintiff is barred, however, from filing any new action IFP while he is a prisoner. *See Fields v. Macomber*, No. 23-CV-01575, 2023 WL 7926803, at *2 (S.D. Cal. Nov. 16, 2023).¹

That order relied on the “three-strikes” provision of the Prison Litigation Reform Act (PLRA), 28 U.S.C. § 1915(g), which provides that:

In no event shall a prisoner bring a civil action [IFP] if the prisoner has, on 3 or more prior occasions, while incarcerated or detained in any facility, brought an action or appeal in a court of the United States that was dismissed on the grounds that it is frivolous, malicious, or fails to state a claim upon which relief may be granted, unless the prisoner is under imminent danger of serious physical injury.

¹ *See Fields v. Newsom*, No. 22-CV-00044 (S.D. Cal. May 16, 2022) (dismissing amended complaint for failure to state a claim and as frivolous); *Fields v. Newsom*, No. 22-55519 (dismissing appeal as frivolous) (9th Cir. Nov. 17, 2022); *Fields v. Bouria*, No. 22-CV-01656 (S.D. Cal. Nov. 18, 2022) (dismissing complaint for failure to state a claim and as frivolous), No. 22-56171 (dismissing appeal as frivolous) (9th Cir. May 18, 2023).

Although Plaintiff has filed this new action seeking IFP status, his complaint does not show that he is in imminent danger of serious physical injury.¹ Instead, Plaintiff alleges that in March 2021, he received a “harmful Pfizer Covid 19 vaccine shot.” (ECF 1 ¶ V.) Plaintiff is therefore barred from filing this action IFP.

CONCLUSION

The Court denies Plaintiff’s request to proceed IFP, and the complaint is dismissed without prejudice under the PLRA’s “three-strikes” rule. *See* 28 U.S.C. § 1915(g).² Plaintiff remains barred from filing any future action IFP while he is in custody, unless he is under imminent threat of serious physical injury.³ *Id.*

The Court certifies, pursuant to 28 U.S.C. § 1915(a)(3), that any appeal from this order would not be taken in good faith, and therefore IFP status is denied for the purpose of an appeal. *See Coppedge v. United States*, 369 U.S. 438, 444-45 (1962).

¹ An imminent danger is one “existing at the time the complaint is filed.” *Malik v. McGinnis*, 293 F.3d 559, 563 (2d Cir. 2002). A danger “that has dissipated by the time a complaint is filed” is not sufficient. *Pettus v. Morgenthau*, 554 F.3d 293, 296 (2d Cir. 2009).

² Plaintiff may commence a new action by paying the filing fee. If Plaintiff does so, that complaint will be reviewed under 28 U.S.C. § 1915A, which requires the Court to dismiss *any* civil rights complaint from a prisoner if it “(1) is frivolous, malicious, or fails to state a claim upon which relief may be granted; or (2) seeks monetary relief from a defendant who is immune from such relief.” 28 U.S.C. § 1915A(b).

³ The Court may bar any vexatious litigant (including a nonprisoner) from filing future actions (even if the filing fee is paid) without first obtaining leave from the Court. *See In re Martin-Trigona*, 9 F.3d 226, 227-30 (2d Cir. 1993) (discussing sanctions courts may impose on vexatious litigants, including “leave of court” requirement).

The Clerk of Court is directed to enter judgment.

SO ORDERED.

During today's assessment Pt expressed wanting to be sad and angry, trying to overcome everything and trying to pursue my freedom.

Being incarcerated caused a lot of my sadness and anger. Pt also expressed having a hard time articulating with others.

Pt has expressed rumination in regards to his court cases, lawsuits and his case directly. Pt appears to have some paranoia surrounding how others view him in which is a reason why he would like help with his communication skills.

Right Bundle Branch Block

my.clevelandclinic.org/health/diseases/21692-right-bundle-branch-block

August 24, 2021

Overview

Cleveland Clinic
©2021

What is right bundle branch block?

Right bundle branch block is an obstacle in your right bundle branch that makes your heartbeat signal late and out of sync with the left bundle branch, creating an irregular heartbeat.

Electrical signals in your heart act like a pacemaker that controls your heartbeats. This signal starts in the sinoatrial (SA) node, which tells your left and right atria (upper heart chambers) to contract. Next, the signal goes to your atrioventricular (AV) node and bundle branches, which make your left and right ventricles tighten.

Normally, the signal goes down both bundle branches at once and both ventricles are working at the same time. When the signal goes down the right bundle branch a little slower than the left bundle branch, the right ventricle contracts later than the left one. This is what's going on when you have a right bundle branch block, and it happens because the signal has to go around a block in the branch.

Because the ventricles aren't working at exactly the same time, this creates an irregular heartbeat (arrhythmia.)

Right bundle branch block can be complete or incomplete. Unlike complete right bundle branch block, incomplete right bundle branch block doesn't increase your risk of heart attack and death.

Who does right bundle branch block affect?

Right bundle branch block can happen in healthy people. It's more likely to happen in older people.

Symptoms and Causes

What are the symptoms of right bundle branch block?

You most likely won't have any symptoms.

What causes right bundle branch block?

There are several causes of right bundle branch block, including:

- Myocarditis.
- Trauma to your chest.
- Heart attack (myocardial infarction).
- Right heart catheterization or other procedures.
- Changes in branch structure, such as stretching.
- Diseases (like Lev's disease or Lenegre's disease).

Diagnosis and Tests

How is right bundle branch block diagnosed?

A provider often finds it during an annual physical.

What tests will be done to diagnose right bundle branch block?

Your healthcare provider will review your electrocardiogram (EKG) results carefully to make sure you don't have a different problem, such as:

- Ventricular tachycardia.
- Brugada syndrome.
- Incomplete left bundle branch block.

Management and Treatment

How is right bundle branch block treated?

Usually, if you don't have symptoms and you don't have heart disease, you don't need treatment for right bundle branch block.

Outlook / Prognosis

What can I expect if I have right bundle branch block?

Right bundle branch block may stay the same without any change or the block may progress to involve other conduction branches.

How long does right bundle branch block last?

Right bundle branch block doesn't go away.

What is the outlook for right bundle branch block?

Your outlook depends on whether you have cardiovascular disease. If you don't have heart disease, having right bundle branch block doesn't change your life expectancy or add to your risk level. But having right bundle branch block can put you at a higher risk of death if you also have heart failure or a heart attack.

Living With

How do I take care of myself with right bundle branch block?

If you don't have symptoms and you don't have heart disease, you don't need to do anything for right bundle branch block. But if you've had other problems like a heart attack or heart failure, you need to continue with treatment for those issues.

When should I see my healthcare provider?

You should see your provider if you have other heart problems in addition to right bundle branch block.

When should I go to the ER?

You should go to the ER if you think you're having a heart attack.

- What caused my right bundle branch block?
- What can I do to keep my heart failure from getting worse?
- How can I take care of myself after a heart attack?

Additional Common Questions

How common is a right bundle branch block?

Many people have right bundle branch block, especially as they age. About 11% of people have this by the time they're 80.

How serious is a right bundle branch block?

If you have no symptoms and no heart disease, a right bundle branch block is not serious. But if you've already had heart failure or a heart attack along with right bundle branch block, it puts you at a higher risk of death.

Is right bundle branch block permanent?

Yes.

Right bundle branch block isn't a cause for worry if you don't have symptoms or heart disease. But when you have right bundle branch block and you've already had a heart attack or heart failure, you should focus on continuing with treatment for those problems. Be sure to follow your provider's treatment plan for the best results.

Transthyretin Amyloid Cardiomyopathy (ATTR-CM)

[heart.org/en/health-topics/cardiomopathy/what-is-cardiomopathy-in-adults/transthyretin-amylid-cardiomopathy-attr-cm](https://www.heart.org/en/health-topics/cardiomopathy/what-is-cardiomopathy-in-adults/transthyretin-amylid-cardiomopathy-attr-cm)

December 8, 2023

What is transthyretin amyloid cardiomyopathy?

Transthyretin (trans-thy-re-tin) amyloid cardiomyopathy (ATTR-CM) is an underdiagnosed and potentially fatal disease of the heart muscle. In ATTR-CM, a protein called transthyretin that normally circulates in the bloodstream becomes misshapen and builds up in the heart, nerves and other organs.

When these amyloid deposits build up in the heart, the walls can become stiff, making the left ventricle unable to properly relax and fill with blood. This is called cardiomyopathy. As the condition progresses, the heart can become unable to adequately squeeze to pump blood out of the heart, ultimately leading to heart failure. There are two types of ATTR-CM – hereditary ATTR-CM (hATTR-CM) and wild-type ATTR-CM (wATTR-CM).

Hereditary ATTR-CM

In hereditary ATTR-CM, which can run in families, there's a variant in the transthyretin gene, which results in amyloid deposits in the heart, nerves and sometimes the kidneys and other organs. Symptoms may start as early as 30, although most present later in life.

Hereditary ATTR-CM is more common in localized parts of Portugal, Brazil, Sweden and Japan; however, there are a number of variants in different parts of the world. Some variants are more common in people of Irish ancestry while others are common among people of African descent.

Different variants may progress in a different way and involve different organs. The most common variant in the United States occurs in 3-4% of all Blacks.

Genetic testing may provide important information to developing a treatment plan.

Wild-type ATTR-CM

In the wild-type ATTR-CM (wATTR-CM), there is no variant in the transthyretin gene. Wild-type ATTR-CM doesn't run in families. It most commonly affects the heart and can also cause carpal tunnel syndrome and pain and numbness in the hands and feet, called peripheral neuropathy. Recent data suggests lumbar spine involvement and forearm tendon rupture may precede cardiac involvement. The disease most often occurs in elderly men.

Getting support for you and your caregivers is important to your health. Research shows that going it alone and not seeking support during a heart diagnosis can reduce your ability to make the lasting changes you need to live a longer, healthier life.
