TIDES AT SOUTH WEST PASS.
at 1000 feet in the station on the island and

TIDES AT SOUTH WEST PASS.

The times and heights of high and low waters are very irregular and much influenced by the direction and force of the wind. The following results are only approximate, having been deduced from short and interrupted series of observations, made in Karl Bay.

REMARKS.

Three tubes are of the diurnal or single day type, there being generally but one high and one low water in 24 hours. But near the time of new declination there are sometimes for one or two days two small tides in a lunar day; though not really noticed unless full or new moon occur about the same time. When the moon's greatest declination occurs at full or change, the rise and fall are greatest, and least when her declination is zero in the first or last quarters.

the limit or high waters. When the moon's declination is greatest north it is high water about 20 hours after our meridian passage, and when it is greatest south, about 8 hours. This rule holds for 3 or 4 days before and after the greatest declination, adding 10 or 15 minutes a day before and subtracting as many after that time. The time thus obtained will be nearest exact in March, April, September and December, but in February and August it will be 10 or 12 minutes to be added late, and as much subtracted in May and November. The 3 or 4 days before and as many after the moon's zero declination the latitudinal interval decreases very rapidly, and sometimes two small tides appear, as above stated, but their times are not well defined. The times and heights will not be materially different at the other Poles of the Moonings.

SOUNDINGS.

The Soundings are expressed in fathoms, or within the dotted line beyond it in fathoms, and show the depth at mean low water, the plane of reference. The dotted surfaces beyond low water mark represent the bottom within the respective depths of 6, 12, and 18 feet.

The characteristic soundings only are given on the map; they are selected from the numerous soundings taken in the survey, so as to represent the figure of the bottom.

NOTES.
The soundings are expressed in feet or fathoms within the dotted line beyond it in fathoms, and when the depth at many places is the same, they are omitted from the numerous soundings. When the soundings are given in fathoms, the figure of the bottom is indicated by the letters.

TIDES.
The relation of tides to the chart is shown in the tide table and tide gauge, which are in the lower left corner of the chart. The tide gauge shows the rise and fall of the tide at the various places, and the tide table shows the time of high and low tide at the various places. The tide gauge is a diagram of a tide gauge, and the tide table is a table of tide data.
